EXPERIMENT 2

UBUNTU

STEP 1

Creating a New Virtual Machine

This step shows the creation of a new virtual machine in Oracle VirtualBox. The Ubuntu ISO image is selected, and VirtualBox automatically detects the operating system version. The unattended installation option is enabled to simplify the installation process.

STEP 2

Configuring Virtual Hardware

In this step, hardware resources are allocated to the virtual machine. The VM is assigned **8000 MB RAM**, **8 CPU cores**, and **30 GB** of virtual disk space to ensure smooth performance during the Ubuntu installation and execution.

STEP 3

Reviewing the Virtual Machine Configuration

This screen displays a summary of all the selected settings before creating the virtual machine. It includes the VM name, Ubuntu ISO, user details, hardware allocation, and unattended installation configuration, allowing the user to verify the setup before proceeding.

STEP 4

Ubuntu Running Successfully

This image shows the Ubuntu operating system successfully installed and running inside Oracle VirtualBox. The desktop environment is fully functional, and applications such as Firefox can be used, confirming that the virtual machine has been created and configured correctly.
